

## Information Sheet: IBIS/CERM Integration

IBIS and CERM (MIS software for Labels & Packaging) now have a new partner integration in a mission to offer fully integrated, automated workflows for the label and packaging industry.

Through this new integration, IBIS bindery finishing machines communicate directly with the CERM MIS Software. In real time, IBIS sends updates on material usage and knows which CERM job is currently running. Thanks to JMF (Job Messaging Format), machine activities like "Running", "Breakdown", and "Job Complete" are automatically registered and sent to CERM's Shop Floor Data Collection module.

The benefit? Live production insights and optimization of your finishing process.

With accurate, real-time data from your finishing equipment, you can track true production costs and optimize your finishing processes like never before. No guesswork — just data you can trust.

This is another powerful example of how partner integrations create transparent, end-to-end production workflows. As always, we're committed to building smart connections with the best in the industry. Partner integrations are the core of workflow automation and business efficiency. The interaction between different operating systems in your central MIS creates limitless possibilities.
